

Option 1: Launching a Website Using GitHub Pages

GitHub Pages is ideal for hosting static websites directly from a GitHub repository. Here are the steps:

Step 1: Create a GitHub Account

Go to GitHub and sign up for a free account if you don't have one already.

Step 2: Create a New Repository

Log in to your GitHub account.

Click on the "New" button or go to Repositories > New.

Name your repository (e.g., my-website) and set it to Public.

Initialize the repository with a README.md file.

Step 3: Upload Your Website Files

On the repository page, click on the "Add file" button > Upload files.

Drag and drop your HTML, CSS, JavaScript files, and any other resources (like images) into the repository.

Click Commit changes.

Step 4: Enable GitHub Pages

Go to the repository settings by clicking on Settings.

Scroll down to the GitHub Pages section.

Under Source, select the branch (usually main or master) and root folder.

GitHub will provide you with a URL for your website, usually in the format:

<https://yourusername.github.io/repository-name>.

Step 5: Visit Your Website

After a few moments, your website will be live at the provided URL. You can visit it to see how it looks.

Option 2: Launching a Website Using Netlify

Netlify is another popular option, especially for deploying modern web apps and static sites. It supports continuous deployment and offers many useful features for developers.

Step 1: Create a Netlify Account

Go to Netlify and sign up for a free account.

You can sign up using your GitHub, GitLab, or Bitbucket account for easy integration.

Step 2: Link Your Git Repository

Once logged in, click "Add new site" and then select "Import an existing project."

Choose the Git provider (e.g., GitHub) where your website code is hosted.

Authorize Netlify to access your repositories.

Step 3: Select the Repository

Choose the repository containing your website files.

Set the branch to deploy (usually main or master).

Leave the build command empty (if it's a static site) or specify a build command if you're using a static site generator (e.g., Jekyll, Hugo).

Step 4: Configure Deployment Settings

For a basic HTML/CSS/JavaScript site, set the Publish directory to the folder containing your index.html (usually the root folder).

Click Deploy site.

Step 5: Your Site is Live!

After deployment, Netlify will provide a temporary URL (e.g., <https://random-name.netlify.app>).

You can visit this link to see your website live.

Step 6: Set Up a Custom Domain (Optional)

Go to Site settings > Domain management > Add custom domain.

Enter the custom domain you registered and follow the instructions to point your domain to Netlify's DNS servers.
